

# CS 6150: HW0 – Introduction and background

Submission date: Saturday, August 24, 2019, 11:00 PM

This assignment has 6 questions, for a total of 50 points. Unless otherwise specified, complete and reasoned arguments will be expected for all answers.

Question	Points	Score
Big oh and running times	10	
Square vs. Multiply	5	
Graph basics	8	
Background: Probability	12	
Tossing coins	7	
Array Sums	8	
Total:	50	

Question 1: Big oh and running times ..... [10]

(a) [4] Write down the following functions in big-oh notation:

1.  $f(n) = n^2 + 5n + 20$ .

2.  $g(n) = \frac{1}{n^2} + \frac{2}{n}$ .

(b) [6] Consider the following algorithm to compute the GCD of two positive integers  $a, b$ . Suppose  $a, b$  are numbers that are both at most  $n$ . Give a bound on the running time of  $\text{GCD}(a, b)$ . (You need to give a formal proof for your claim.)

---

**Algorithm 1**  $\text{GCD}(a, b)$

---

if  $(a < b)$  return  $\text{GCD}(b, a)$ ;

if  $(b = 0)$  return  $a$ ;

return  $\text{GCD}(b, a \% b)$ ; (Recall:  $a \% b$  is the remainder when  $a$  is divided by  $b$ )

---

Question 2: Square vs. Multiply ..... [5]

Suppose I tell you that there is an algorithm that can square any  $n$  digit number in time  $O(n \log n)$ , for all  $n \geq 1$ . Then, prove that there is an algorithm that can find the product of *any two*  $n$  digit numbers in time  $O(n \log n)$ . [Hint: think of using the squaring algorithm as a subroutine to find the product.]

Question 3: Graph basics ..... [8]

Let  $G$  be a *simple*<sup>1</sup> undirected graph. Prove that there are at least two vertices that have the same degree.

Question 4: Background: Probability ..... [12]

(a) [3] Suppose we toss a fair coin  $k$  times. What is the probability that we see heads precisely once?

(b) [4] Suppose we have  $k$  different boxes, and suppose that every box is colored uniformly at random with one of  $k$  colors (independently of the other boxes). What is the probability that all the boxes get distinct colors?

(c) [5] Suppose we repeatedly throw a fair die (with 6 faces). What is the expected number of throws needed to see a '1'? How many throws are needed to ensure that a '1' is seen with probability  $> 99/100$ ?

Question 5: Tossing coins ..... [7]

Suppose we have two coins, one of which is *fair* (i.e.  $\text{prob}[\text{heads}] = \text{prob}[\text{tails}] = 1/2$ ), and another of which is slightly biased. More specifically, the second coin has  $\text{prob}[\text{heads}] = 0.51$ . Suppose we toss the coins  $N$  times, and let  $H_1$  and  $H_2$  be the number of heads observed (respectively).

(a) [3] Intuitively, how large must  $N$  be, so that we have  $H_2 > H_1$  with "reasonable certainty"?

(b) [2] Suppose we pick  $N = 25$ . What is the expected value of  $H_2 - H_1$ ?

(c) [2] Can you use this to conclude that the probability of the event  $(H_2 - H_1 \geq 1)$  is small? [It's OK if you cannot answer this part of the problem.]

Question 6: Array Sums ..... [8]

Given an array  $A[1 \dots n]$  of integers, find if there exist indices  $i, j, k$  such that  $A[i] + A[j] + A[k] = 0$ . Can you find an algorithm with running time  $o(n^3)$ ? [NOTE: this is the little-oh notation, i.e., the algorithm should run in time  $< cn^3$ , for any constant  $c$ , as  $n \rightarrow \infty$ .] [Hint: aim for an algorithm with running time  $O(n^2 \log n)$ .]

---

<sup>1</sup>I.e., there are no self loops or multiple edges between any pair of vertices.
